

Kubernetes Laboratory and Corpus-Preservation Exercise

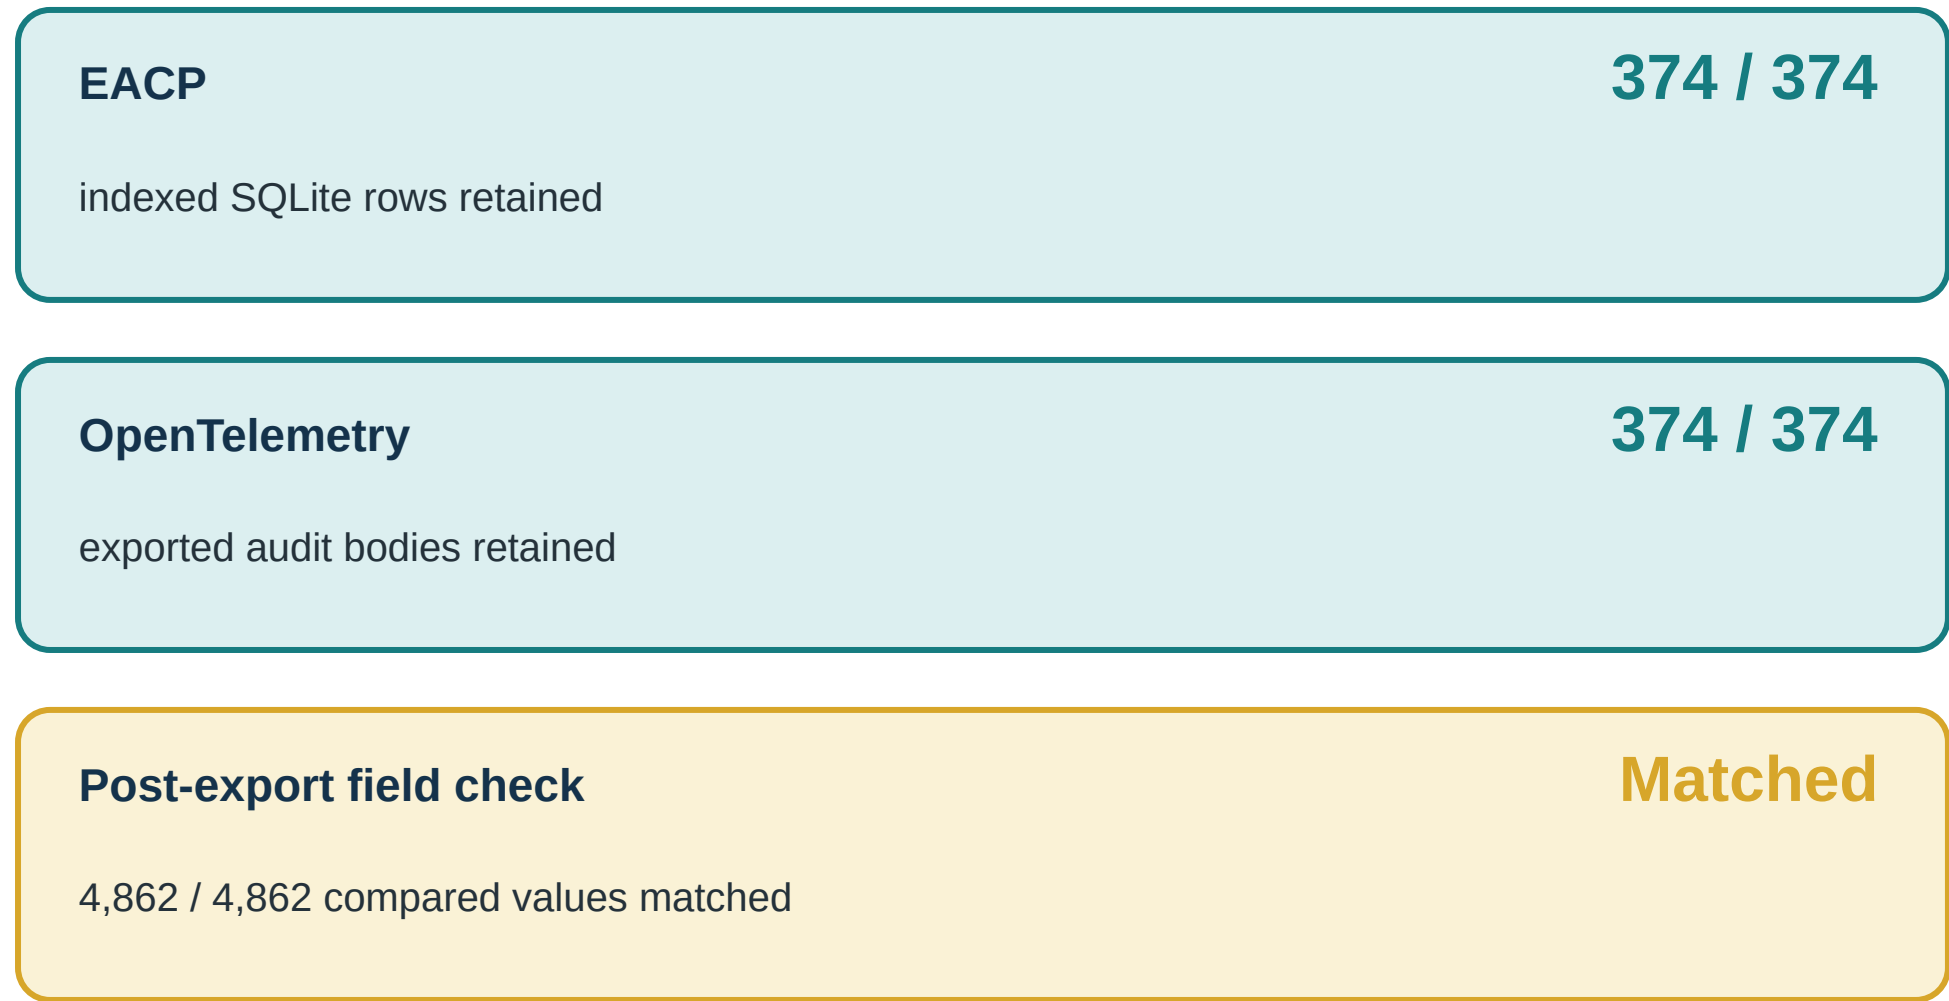

One frozen, sanitized audit corpus - ten fresh sequential replays per pipeline

A. Executed Kubernetes corpus

B. Event preservation

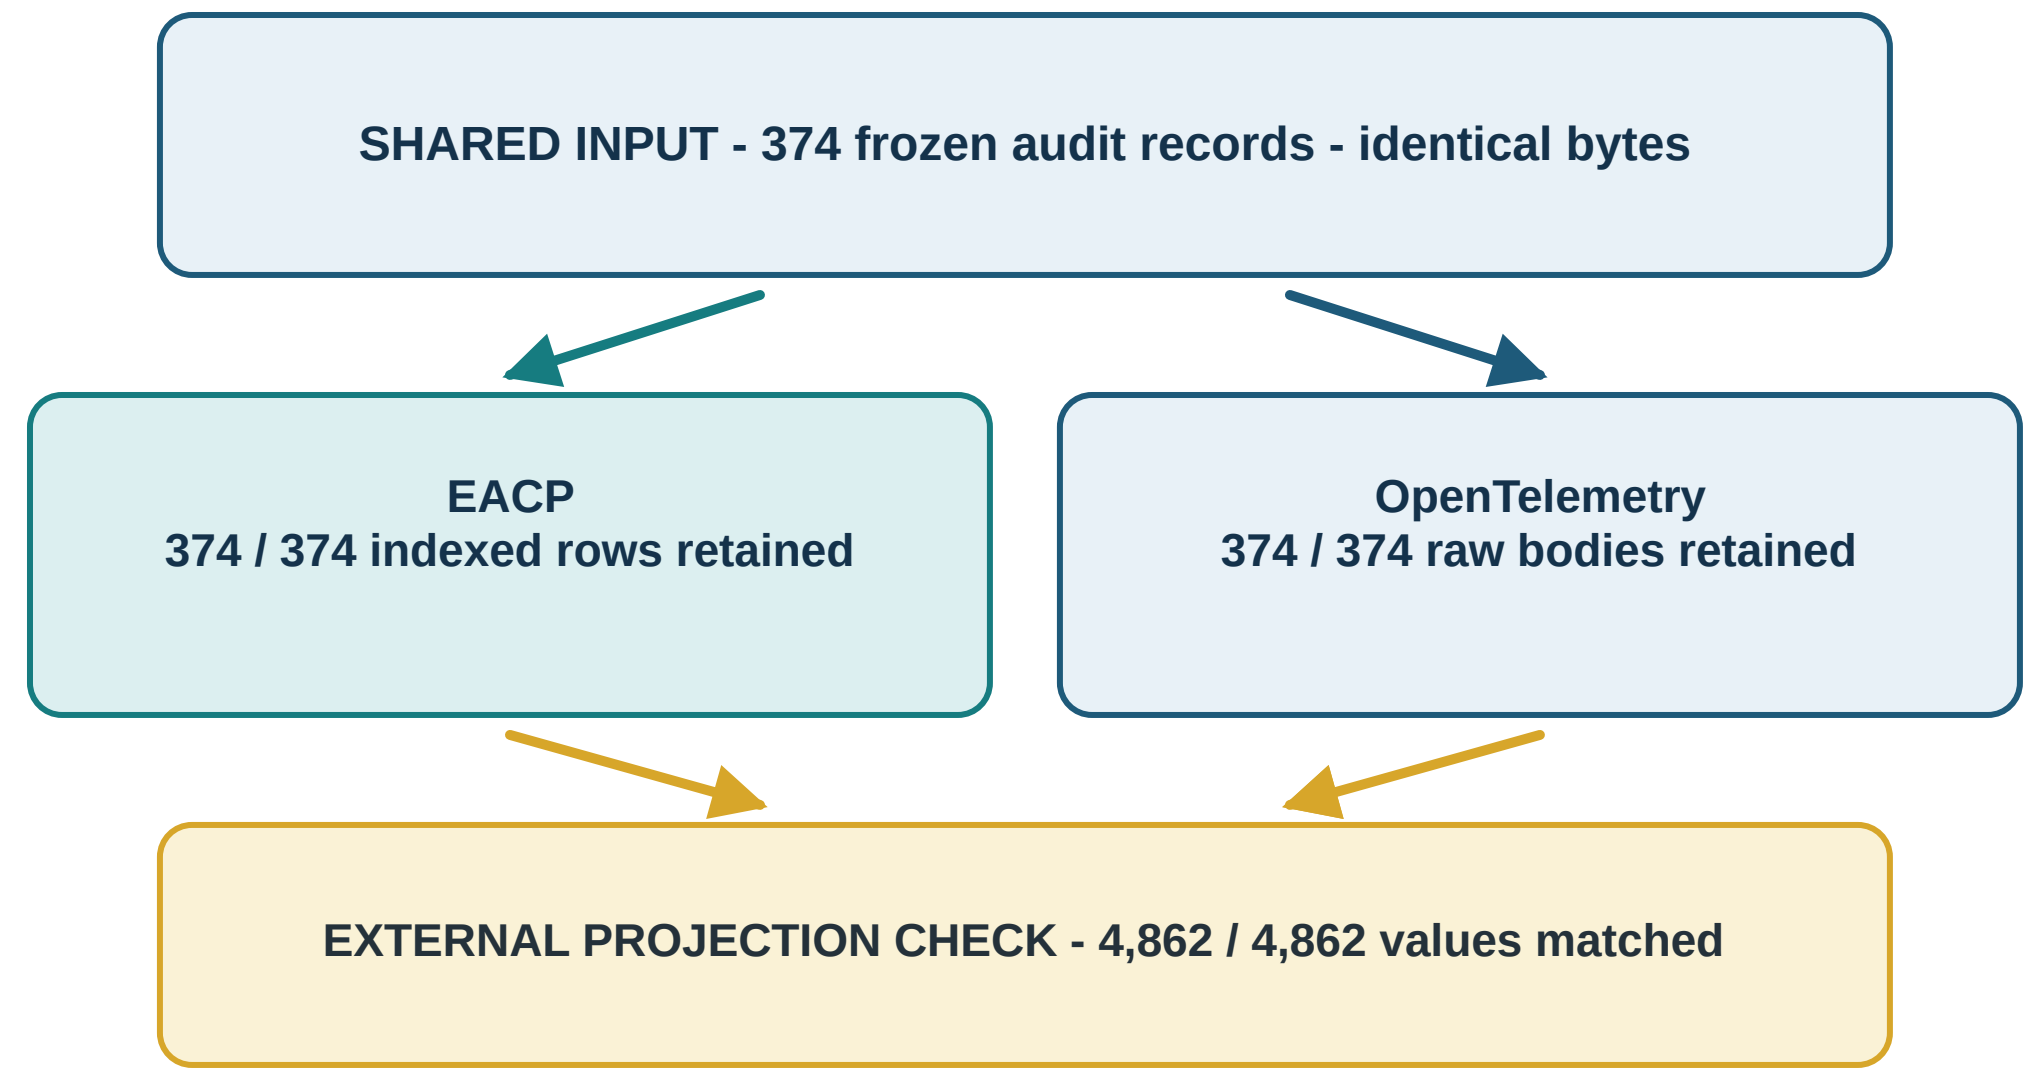

Canonical projection checked after each replay

No SQLite-versus-file query comparison was performed.

C. Interoperability reference exercise

Same frozen bytes; distinct output and query semantics

Shared input SHA-256: 6aa39ee1...5400e01 - Collector Contrib 0.158.0 image digest: sha256:c5918f78...a32ed5

Scope: bounded replay and corpus preservation only - no performance ranking - no claim of Collector-native EACP semantics
